Information about evolutionary events hundreds of millions of years ago is mainly gleaned from fossils. Familiar fossils are shells, exoskeletons and bones that organisms make while alive.

How should the concept of evidence be understood? And how does the concept of evidence apply to the controversy about creationism as well as to work in evolutionary biology about natural selection and common ancestry? In this rich and wide-ranging book, Elliott Sober investigates general questions about probability and evidence and shows how the answers he develops to those questions apply to the specifics of evolutionary biology. Drawing on a set of fascinating examples, he analyzes whether claims about intelligent design are untestable; whether they are discredited by the fact that many adaptations are imperfect; how evidence bears on whether present species trace back to common ancestors; how hypotheses about natural selection can be tested, and many other issues. His book will interest all readers who want to understand philosophical questions about evidence and evolution, as they arise both in Darwin's work and in contemporary biological research.

Explores both the development of the science of evolution and the potentials of new technologies to change future evolution, as well as examining the implications of these developments

Experimental evolution is a powerful method in the study of adaptation, at the level of both phenotype and genotype. The dissertation research used a long-established system of experimentally-evolved populations of Drosophila melanogaster to answer questions about the nature of differentiation between populations selected for various life-history characters. The first chapter of this dissertation introduces the experimental evolution strategy, and its history with of Drosophila. It also provides an overview of the laboratory system featured in subsequent chapters. The second chapter of the dissertation examines the evolutionary trajectory of a candidate gene, of hsp26, over ~ 30 generations of laboratory natural selection for accelerated development. Clear evidence was found suggesting that hsp26 expression decreases in response to laboratory selection for accelerated development, but ultimately is lowest in lines selected for intermediate development time. These results support previous studies that suggest that this gene has pleiotropic effects, and its evolution is correlated with both postponed reproduction and accelerated development. The third chapter of the dissertation provides whole-genome resequencing data from Drosophila populations that have undergone 600 generations of laboratory selection for accelerated development. Several dozen genomic regions showed strong allele-frequency differentiation in response to selection, but did not show evidence of the fixation of beneficial alleles. These results differ from those of similar studies in asexual populations, and demonstrate the utility of genomic data from experimentally evolved, sexually reproducing populations. The fourth chapter of the dissertation examines immune response in Drosophila populations selected for postponed reproduction. In Drosophila, this phenotype is complex and potentially correlated with many other life-history characters. Immune response was assayed in experimental and control populations by manually injecting large numbers of flies with the entomopathogen Serratia marcescens. The longer-lived populations showed an improved ability to survive and clear bacterial infection, across a wide range of ages. These results suggest that improved immune function is positively correlated with later-life fitness-components.

Closing in the present day with a discussion of the 2017 March for Science and the prospects for science and science diplomacy in the Trump era, the book demonstrates the continued hold of Cold War thinking on ideas about science and politics in the United States.

Evolution and Creation are in a spiritual battle. Evolution scientists ignore, dismiss, and unequivocally reject Creation out of hand It is not science or fact as evolution is, they say. However, Nullifying God shows that random Darwinian evolution does not have the direct evidence required to support the claim. Not only that, but it provides contrary evidence that evolution is biologically impossible. Because that is the case, evolution can only persist in the unchallengeable authority it needs to maintain its position by actively attempting to nullify its alternative Creation, and therefore, the Bible and God. Nullifying God was especially written to empower and benefit believers who are not familiar with science to show them that evolution cannot be fact and is not science. It does so by: 1) providing them with a core foundation of applied science principles to rationally question evolutions claims, then 2) guiding them into solid, clear knowledge of why evolution is biologically impossible, and finally 3) presenting them with examples that document evolutions attempts to nullify God. The bottom line is Biblical Creation is the only answer that explains life.
