The essays here address the relationship between economic interdependence and international conflict, the political economy of economic sanctions, and the role of economic incentives in international statecraft.

Managers of workforce training programs are often unable to afford costly, full-fledged experimental or nonexperimental evaluations to determine their programs' impacts. Therefore, many rely on the survey responses of program participants to gauge program impacts. Smith, Whalley, and Wilcox present the first attempt to assess such measures despite their already widespread use in program evaluations. They develop a multidisciplinary framework for addressing the issue and apply it to three case studies: the National Job Training Partnership Act Study, the U.S. National Supported Work Demonstration, and the Connecticut Jobs First Program. Each of these studies were subjected to experimental evaluations that included a survey-based participant evaluation measure. The authors apply econometric methods specifically developed to obtain estimates of program impacts among individuals in the studies and then compare these estimates with survey-based participant evaluation measures to obtain an assessment of the surveys' efficacy. The authors also discuss how their findings fit into the broader literatures in economics, psychology, and survey research.

Computer simulation modeling is a discipline gaining popularity in both the government and industry. It can assist in the design, creation and evaluation of complex systems. Designers, program managers, analysts and engineers use computer simulation modeling to understand and evaluate [what if] case scenarios. One can model a real or proposed system using computer software, which is useful when changes to the actual system are difficult to implement, involve high costs or are impractical. Some examples of computer simulation modeling familiar to most of us include weather forecasting, flight simulators used for training pilots and car crash modeling. Modeling & Simulation (M&S) has become an important tool in all phases of the acquisition process and can be used within most systems' lifecycles, including requirement analysis, architectural design, design and development, tests and verifications and operations and maintenance. The science of modeling and simulation strives to showcase the highest possible level of reality to determine the conditions necessary for optimal performance. Modeling and simulation is a multifaceted and complex field due to the numerous applications involved, particularly since M&S applications range from nuclear reactions to supermarket queuing.

Evaluates the theoretical arguments about the relationship between foreign economic relations and political-military hostilities. This title offers a hands-on introduction to key analytical methods for dynamic modelling. Bringing together tools and methodologies from fields as diverse as computational statistics, econometrics, and operations research in a single text, it can be used for graduate-level courses and as a reference for dynamic modellers who want to expand their methodological toolbox.

Macrocomparative researchers use a variety of methodological approaches. This book features analyses of a single substantive topic, comparative employment performance in affluent countries, using three of the most common macrocomparative techniques: pooled cross-section time-series regression, qualitative comparative analysis, and small-N analysis.

Leading historians trace the changing fortunes of the social science of social problems since World War II.
