Getting Started with CNC is the definitive introduction to working with affordable desktop and benchtop CNCs, written by the creator of the popular open hardware CNC, the Shapeoko. Accessible 3D printing introduced the masses to computer-controlled additive fabrication. But the flip side of that is subtractive fabrication: instead of

adding material to create a shape like a 3D printer does, a CNC starts with a solid piece of material and takes away from it. Although inexpensive 3D printers can make great things with plastic, a CNC can carve highly durable pieces out of a block of aluminum, wood, and other materials. This book covers the fundamentals of designing for--and working with--affordable (\$500-\$3000) CNCs.

A practical approach to using the CNC mill, aimed at everyone with a workshop, particularly modelmakers and horologists CNC (computer numerical control) milling machines are now available to even the smallest of workshops, allowing designers to be more ambitious and machinists to be more confident of the production of parts, greatly increasing the potential of milling at home. This accessible guide takes a practical approach to software and techniques, and explains how you can make full use of your CNC mill to produce ambitious works of a high standard. It offers authoritative advice on programming and operating a CNC mill and a guide to the major CAD/CAM/CNC software such as Mach3, LuxCNC, and Vectric packages, without being restricted to any particular make of machine; as well as practical projects and examples of a wide range of finished work.

New in Paperback. The Douglas DC-3 Dakota revolutionized air transport in the 1930s and 1940s. Designing beautiful boards and making smooth animation come naturally to us Motion Designers. It's what we're good at. However, designing the career we want, with the freedom, flexibility, and pay we crave, that's more difficult. All of the above is within your grasp if you're willing to take the plunge into freelancing. Soviet Robots in the Solar System provides a history of the Soviet robotic lunar and planetary exploration program from its inception, with the attempted launch of a lunar impactor on September 23, 1958, to the last launch in the Russian national scientific space program in the 20th Century, Mars 96, on November 16, 1996. This title makes a unique contribution to understanding the scientific and engineering accomplishments of the Soviet Union's robotic space exploration enterprise from its infancy to its demise with the collapse of the Soviet Union. The authors provide a comprehensive account of Soviet robotic exploration of the Solar System for both popular space enthusiasts and professionals in the field. Technical details and science results are provided and put into an historical and political perspective in a single volume for the first time. The book is divided into two parts. Part I describes the key players and the key institutions that build and operate the hardware, the rockets that provide access to space, and the spacecraft that carry out the enterprise. Part II is about putting these pieces together to enable space flight and mission campaigns. Part II is written in chronological order beginning with the first launches to the Moon. Each chapter covers a particular period when specific mission campaigns were undertaken during celestially-determined launch windows. Each chapter begins with a short overview of the flight missions that occurred during the time period and the political and historical context for the flight mission campaigns, including what the Americans were doing at the time. The bulk of each chapter is devoted to the scientific and engineering details of that flight campaign. The spacecraft and payloads are examined with as much technical detail as is available today, the progress is described, and a synopsis of the scientific result is given.

Successful cycling planning depends on combining improvements to infrastructure with education. There are chapters examining both national strategies and local initiatives in cities around the world, including such topics as changes to existing road infrastructure and the integration of cycling with public transport. Since education is a critical element in cycling planning, contributors also consider such topics as developing healthy travel habits in the young and ways of promoting cycling. A number of chapters look at the complex relationship between cars and cycling, discussing how roads can be successfully shared between these two modes of transport. With its blend of practical experience and suggestions for improvement, Planning for cycling is essential reading for urban planners, environmental groups and those researching in this area. Describes how creating an effective policy for cycling involves combining improvements to infrastructure with education Chapters examine both national strategies and local initiatives in cities around the world
