Examines experience in integrating private management and capital with public transport policy objectives in a number of developed economies.

Better Public Transit Systems is a complete primer for performance and investment analysis of public transportation. Whether you're planning a major new public transit project, an extension or expansion of an existing system, or evaluating the needs of your current system, this book provides the tools you need to define your goals and objectives and conceive and analyse design alternatives. This completely revised Second Edition includes new material for students and online discussion questions, whilst remaining an essential reference book.

Better urban transport systems are needed to achieve a healthier environment and as a result, a wide range of research has originated from many different countries. These studies highlight the importance of innovative systems, new approaches and original ideas, which need to be thoroughly tested and critically evaluated before they can be implemented in practice. To address the need to solve important pollution problems the papers included in this book focus on the relationship with urban transport. There is also a growing need for integration with telecommunications systems and IT applications in order to improve safety, security and efficiency. The variety of topics covered in this volume reflects the complex interaction of the urban transport systems with their environment and the need to establish integrated strategies. The aim is to arrive at optimal socio-economic solutions while reducing the negative environmental impacts of current transportation systems.

The continuing requirement for better urban transport systems and the need for a healthier environment have led to an increased level of research around the world. This is reflected in the proceedings presented at the well-established International Conference on Urban Transport and the Environment in the 21st Century. This volume presents the steady growth in research into urban transport and will be of particular interest to engineers, scientists and managers working in industry, universities, research organizations and government; involved in the planning and management of urban transportation systems and transport policy. The variety of topics covered are of primary importance for analysing the complex interaction in the urban transport environment and for establishing action strategies for transport and traffic problems. Featured topics include: Transport Modelling and Simulation; Public Transport Systems; Traffic Integration and Control; Infrastructure and Maintenance; Transport Sustainability; Environment and Ecological Aspects; Air and Noise Pollution; Energy and Transport Fuels; Transport Security and Safety; Road and Parking Pricing; Economic and Social Impact; Land Use and Transport Integration; Advanced Transport Systems; Transportation Demand Analysis.

needed to evaluate each for given circumstances.

The 41 papers include most of the presentations at the conference, and provide an international perspective on efforts to create integrated transportation systems in cities without utterly ruining the environment. The perspective is also multidisciplinary, with contributions from transportation systems, environmental studies, planning, funding, management, vehicle and transport technology, transport modeling, and traffic studies. The main themes are rail transportation systems, bus and freight transport systems, private vehicle studies, general transportation systems, residential and pedestrian studies, studies of user's choices, future vision, and environmental aspects. Case studies come from such places as Argentina, Scotland, the Netherlands, Croatia, Japan, Ireland, and Germany. Reproduced from typescripts, some double spaced. No subject index.
